World Coding Day

Good morning everyone,

I am a Namitha from I BCA-A. Today I am excited to talk about **World Coding Day**, which is celebrated on 29th October that is today.

You may ask, what is coding and why do we need a day for it?

Coding is the language that tells computers, phones, robots and websites what to do. Without coding, apps like Whatsapp, games like Minecraft and even google search would not exist. In short, coding runs our digital world.

World Coding Day was started by UNESCO in 2023. The first global celebration took place in 2024. The main goal of this day is to show how important coding is and to encourage people of all ages to learn it.

On this day, schools, colleges and tech companies organize workshops, coding competitions and hackathons.

Beginners are encouraged to write their first line of code, while advanced programmers solve challenging problems. It is a day to learn, create and have fun with technology.

Even in India, coding is becoming very important. The govt. is promoting Digital India and encouraging startups in technology. Programs like these show that coding is not just for beginners – it is for everyone who wants to create and solve problems enhancing the creativity, logical skills and problem solving skills.

So, this 29th October, let's celebrate World Coding Day. Let's appreciate, learn and maybe try it ourselves. Who knows, one of us might create the next big app or technology that changes the world.

Remember, every big innovation starts with just one line of code. So, let's keep learning, keep experimenting and keep creating.

Thanking you.
